Analysis review checklist

1. Is the proposed analytical approach appropriate for the study design and research questions? • Is the analytical approach consistent with the data collection method and sample size? • Is the analytical approach (e.g., descriptive, statistical modeling, thematic) clearly stated and justified?
2. Does the analysis plan map back to each study question? • Is it clear which analyses addresses which study question? • Are there any study questions that are not addressed by the proposed analysis?
3. Are the proposed indicators, variables, or constructs clearly defined and measurable? • For quantitative studies, are variables operationalized clearly? • For qualitative studies, are themes/ constructs grounded in the questions intended for the participants?
4. Are limitations and assumptions acknowledged? • Has the Study Owner accounted for potential sources of bias (e.g., self-reported data, confounding factors)? • Are assumptions about the data or population clearly stated?
